

BLOOM THE DESERT

Executive Summary

Introduction

Bloom the Desert (BTD) brings together many Earth friendly cutting edge technologies and low cost approaches for the rejuvenation of arid land, under performing farms, damaged and polluted land. Whole regions of planet Earth can be rejuvenated into blooming, thriving, blossoming, enriching, flourishing, beautiful natural agricultural lands and communities.

Our trial farm in Dubai proved up several BTD technologies. We reduced the high salt desert sands of 13.2 pH to a measured 8.2 pH, by using our tailored made salt reducing microbes, sea water extracted 'ormes', biochar and 'implosive treated water'. We grew vegetables in the desert without any fertilizers. Pictures, video and independent validation is available on our website. We have the unique ability to grow crops in desert arid lands using our low cost methods. We are looking for sponsors for our next project which would be building on what we have already proven in Dubai. Essentially, we can find water anywhere, we can create 'fertile soil' anywhere, we can grow food and build eco sustainable dwellings- anywhere. A possible solution to many of the worlds problems is to start using arid land for agriculture and communities.

Our technologies are categorized under the following components:

Primary Water

The key theory is that primary water is formed deep inside the crystalline rock strata of the Earth's crust. With proper understanding of how to find deep 'primary water', abundant water is located where it is most needed, including arid regions. This has been proven many times (see references/film clips).

Implosive Water Treatment

The 'Super Imploder' device facilitates a de-clustering effect on water, the result is a dramatic increase in solubility and bioavailability which increases crops nutrition density and yields, along with saving on water consumption. Over time, it can help restore a beaten landscape, to the beauty it once possessed.

Creating fertile Soil

New and revolutionary recipes for effective salt reducing microorganisms are combined with other components of 'Bloom the Desert' technologies to completely transform arid land into fertile land (including natural pest control) BTD microbial formulations are unique and proven to work in our Dubai desert farm trails.

AURA tower is technology that connects between Earth and Sky to facilitate accelerated growth, pest control, as well as weather control. It does this by using signals transmitted that "link" between living matter growing in the soil and energetic signatures in the atmosphere.

Living dwellings, sustainable communities and Flourishing Cities : Full Spectrum Architecture

Starting from the ground up (water, soil, food), BTD technologies can rebuild reshape and grow cities. Based on geometrical patterns, fractal electric fields that are life enhancing 'Full Spectrum Architecture' is a revolution in urban design and community planning. BTD technologies generates a "Fractal Attractor" attracting life force, health, commerce, tourists, abundance and money. BTD can build on cheap arid desert regions anywhere on the planet. All humans are entitled to clean air, water, food, shelter, energy supply, adequate infrastructure and effective education - in short an environment where people can live a healthy, safe and fulfilling life - where humans thrive.
